For Derek since the seed is 300, the first tweet in the picture called “potentential continuation uptrend” is from location 300 in the test data. As for Mitesh, since the location is 800 the first one show that Centrica extends gas deals. As one could see there seems to be around a 50 percent accuracy rate for both subtasks. For example, the long and red is neutral bit the I can play the 4/30 announcement is positive. However, one could see the there are some inaccuracies especially in 3 in subtask 1. This is definitely a negative but it was shown as a neutral. This makes sense since out model for both subtasks have an accuracy of 50 percent.
